

66th

SEED DISTRIBUTION

Send requests for seeds to:
Dr Alan J Hayes,
31 Liberton Brae,
Edinburgh,
EH16 6AG,
Scotland.

Send seed donations to:
Prof G Stuart Pawley,
Acres of Keillour,
Methven,
Perth, PH1 3RA,
Scotland.

Please read page 2 and the notes in the Yearbook

The Scottish Rock Garden Club

66th Seed Distribution, 2012/13

It is a surprise we have a list this year with a wash-out in UK, tales of woe from the continent, and the failing rains in Spain. But we are made of sterner stuff, and say thanks for the donation from the US member losing house and garden in the Colorado fires! There is somewhat less seed this session, but no drop in the range of new taxa.

Application

As usual this year, you can apply for seed using the order forms in the centre of the booklet, sending these to Alan Hayes, or you can choose to go online at the SRGC website (www.srgc.org.uk) to make your booking, using the latest password. Even if you send in an order on the paper forms by post, you will be able to pay for seed by credit card online in Sterling, but **not** by debit card. All orders must be received by January 15th. Donors may choose 25 packets, non-donors 16 packets. Please follow the instructions carefully, and write legibly to ensure we pick the items you want. The charge for the main order for UK members is £4, but this charge is included in the subscriptions of overseas members. The procedure and cost for surplus seed is detailed on the Surplus order form.

Distribution

Distribution of seed starts in January, first the main orders for donors, then for non-donors, and finally for surplus seed applications. We expect main orders to be sent out by 21st January; surplus orders will not be selected or posted until that day, after all main orders have been fulfilled. Your main and surplus orders will therefore arrive some days or weeks apart. We urge US members to send all paperwork with the request form – see centre page (i) – unless this was sent with your seed donation.

Phytosanitary restrictions outwith European Union

As before, US members should not choose any items marked with a black spot[•]. All members outwith the EU are not allowed to be sent ‘live material’, which means bulbs, bulblets, corms, rice. Such items will be marked ◆ if the donor had made it clear. For their phytosanitary authorities, Australian, New Zealand and US members must write a separate list of items requested which must include the names, as they did last year. US members should note that they are welcome to send the yellow & green forms to me next year with their seed donations.

About the list

Again the RHS Plant Finder¹ is my primary information source for avoiding duplicate entries under different names, and redirecting arrows are used to help those who still use an old name. Species not in the Plant Finder (there is a version on the internet) are checked with the IPNI website², and if not found there or by a wider search (googling) they are marked †. Accuracy in naming cannot be certain, but plants should have been examined by the donors before collecting seed for the Exchange. It should be remembered that named varieties rarely come true, so ‘ex’ must always be assumed.

After the genus name the sequence is sp., donor’s form descriptions, named varieties, then species; the same sequence is used after the species name: forms, varieties and subspecies. Some unknown species are offered as sp., and an entry spp. means that there is a mixture of species of that genus.

The Seed List will soon appear on the website, and will be available for the season, so when your seed packets arrive labelled only with the current list number and you have unfortunately lost this listing, you can identify them in this way.

Botanical families have again been added to the genera with a three-letter code, either the first three letters of the family name, or the code given in the Notes. Genera in the wild section not appearing in the garden section have also got their families identified.

A few entries have been marked ‡, which alerts you to the fact that a specific mention is made in the Notes at the end of the listing. Don’t miss the chance to follow up the article in ‘The Rock Garden’ this summer.

Stuart Pawley

WILD COLLECTED SEED

We are indebted to those who take the considerable trouble to collect seed in the wild. Collectors are assigned a number, and the main collection provenances are given. The collector's number will be written on the packet where a choice has been made, giving useful information about your seed.

Notes

Password for Web Users For this session you will find in the July Journal.

Treasures from North America Following up his article in the July Journal, Edward Alverson sends us *Camassia* seeds. The garden seed is denoted ‡, and is *C. scilloides* and *C. leichtlinii suksdorfii*, the white-flowered form. The wild collection (collector 50) is from Oregon, except *C. quamash azurea* from Washington State. The entry *C. leichtlinii suksdorfii*, marked 50x, is not so tall and a lighter blue than the entry simply marked 50.

Meconopsis news Some folk do read these Notes. Last year *Meconopsis napaulensis* was said to be a taxonomic problem as the pure species may not be in cultivation. Now you can see for yourself if this old favourite might be a hybrid of *M. staintonii* with other species with more familiar names. This year we have *M. staintonii* from a collection by Chris Chadwell (CC 3964) in 2001 from the north-east Dhaulagiri Himal which has been kept uncontaminated every year since then. Please will members keep it pure and keep it coming back! *M. betonicifolia* (Delavay, 1889, Yunnan) is now listed as *M. baileyi* (Prain, 1915, Tibet) in the Plant Finder. This change is a mystery as IPNI shows the former to be the prior. To celebrate, we have a cluster-headed form this year, to be kept well away from the form from Doshong La which has flowers all the way down the stem.

Stop press! Enlightenment: *M. baileyi* must have been demoted since naming, as it is now promoted back to species level, while *M. betonicifolia* is regarded as a different species, and is stoloniferous. Message: keep tags on labels for the special forms in the list and expect more news next year, same time, same place.

Complex Crossing Two donors from Oz have sent in monocot crosses, the first from Fermi being between two different genera, made by him. There was just room in the list to get in the details, *Habranthus robustus* × *Zephyranthes* ‘Grandjax’, the latter being listed in Plant Finder. If other members have similar triumphs please let me know for this page. Perhaps the following was made by Anne, a lily described as ((Formolongi × Augusta Strain) × (*longiflorum* ‘White Fox’ × *wallichianum*)). Abracadabra, a new algebra!

We have some Crazy Donors Crazy about certain genera or species, giving the list a little twist. Many more *Viola* appear this session, a number making their debut. But take a look at *Hepatica* with two dedicated donors. It was an error last year as the very special crosses from Japan were not little bulbs; we have some more so must try harder. Alongside these crosses are a number of forms lovingly selected, here to tempt you.

Post and Packing Problems? Too many UK donors use insufficient postage for a package that can be too thick. A number of donors meticulously stick packets together, extra work for you and a **lot** of extra work for me. Best is to have them all in a jumble, or in neat rows in a chocolate box. No duplicate packets please, (but don't throw the extra seeds away!), no huge leaky packets, and please label packets clearly on the **outside**!

Introducing e-mailing of donation lists has been a success, but please will UK donors not use this facility except with reason, as it is considerable extra work, and our postal system delivers reliably within a few days. Some overseas packets can take over two weeks, so it is these I wish to know are on their way. Next year I hope gsp.srgc@tesco.net will still be in operation. Please all, do not use this as procrastination, the thief of my time!

Seed Ratings Taxon popularity is monitored every year as guidance to the packers who must guess how many packets to make up. Here's one taxon I would like to succeed with, seeded number 70 this year: *Alstroemeria patagonica*. A donor says this must be sown in the autumn, so that's what we must do.

When the Old Diehard said:

“I must have licked over 2000 seed packets over the years by now”

it got me wondering what the scores might be. He is probably correct, but his total from the archive was not quite there yet, as he had been over-zealous at times and sent in more than one packet of some taxa (tut tut!). I'm glad to say this zealosity is cured, and some time soon he can celebrate. Here are the scores for the current donorship, number of donors up the page, totals in steps of 25 across the page, ending 4300 packets (0–100 not shown). We must thank these generous donors for all their patient effort on our behalf over many years.

Best Kije *Grynaium bourgatii* looks convincing indeed! 'Tis a ghost writer making the label a tad tricky to decipher!

A Question too far: “What are the rules for inclusion in the list?” Most are off the cuff rules of thumb, knowing taxon popularity and guessing donor’s specialisation. Some taxa even get missed by accident! Not all donor’s form notes on the packet get in the list, so you don’t get: “Isn’t it maddening when a name won’t come?”

Families in the list The three-letter code used in the list is either the first three letters of the family, or the code given below. The *Liliaceae* splitting is indicated by * in the table below. In the wild collected seed section, only genera not appearing earlier in the list have the family code.

The families are included in the list to give a hint that for a genus you don’t recognise the species concerned may have similarities with those of a genus you know well.
